

Butterfly Weed *Asclepias tuberosa* is a native perennial that serves as both a host plant for Monarch Butterflies reproduction and a general nectar-rich Butterfly Magnet. It grows well in our location.

It grows to 18 inches in height and 24 inch in width. Likes full sun and good drainage.

Butterfly weed can be propagated by seed or by root cuttings. Because butterfly weed has a long taproot, which can be very difficult to transplant, propagation by seed is highly recommended. Seeds can be harvested and saved around the beginning of fall.
